

# BOREALIS MOBILE APPLICATION

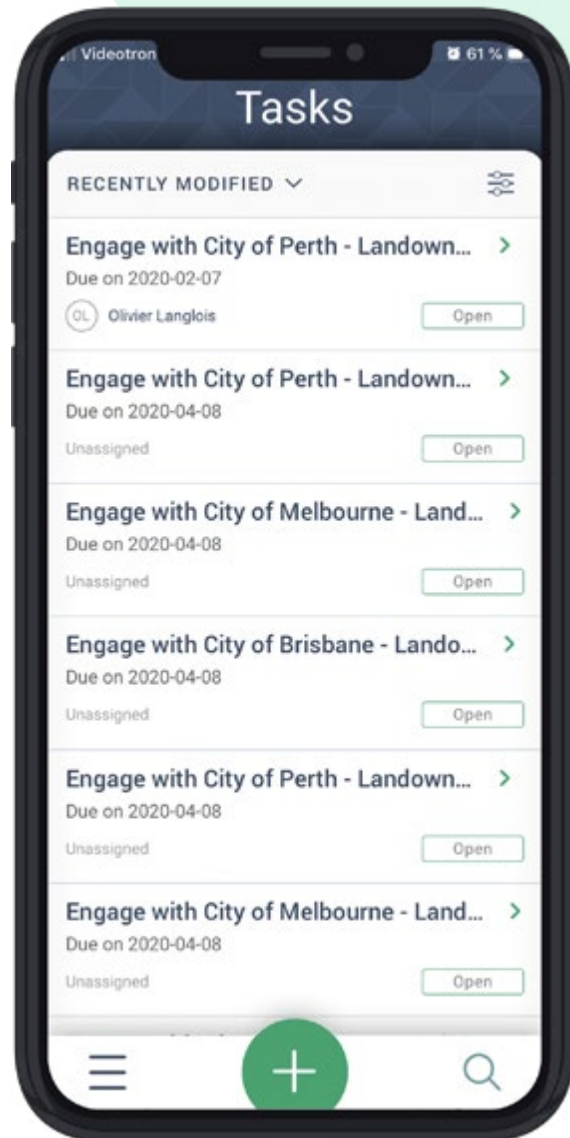

**This document is made to be use by your IT department and Boréal.**

The Boréal mobile app is a great time saver when working in the field. Boréal users no longer need to come back to their desktop to enter communications or add new contacts to Boréal; they can simply add them anytime, anywhere, using their smart phone.

## A few of the tasks that can be done with the mobile app?

- Record communication notes on the go
- Prepare for meetings by looking up stakeholder information
- Create stakeholders from your phone's contact list
- Create a new stakeholder from scanning a business card
- Use your phone's voice-to-text function to dictate information to the app
- View, create and complete tasks
- Create tasks to follow up on an issue observed or discussed with a stakeholder
- Update your individuals, organisations, and communications

Please note that not all information can be updated via the mobile app.

## Sections of Boréalís software available on the mobile app.

- Individuals
- Organisations
- Communications
- Tasks

## Compatibility

- iOS
- Android

## Data security

Boréalís integrates industry standard security practices into its software and extends them to data storage in a hardened and secure hosting infrastructure. Security is integrated into the architecture, policies and procedures of Boréalís software. This also applies to our mobile app.

- No data is stored locally on the device. As with the web version of Boréalís, data is always located on our robustly secured server.
- SAML authentication is supported. When users connect to the Boréalís Application through the mobile app, they are redirected to the corporation's login page to complete authentication. Once authenticated, the user is automatically redirected to Boréalís.

## How to use the Boréalís mobile app

- Download the app from your App store
- Log in with your Boréalís username and password
- Roam free
- Use the app to keep your stakeholder data in Boréalís complete and up to date

- All mobile routes go through the same Penetration testing procedure as the Web application. Boréalís uses third-party security specialists and enterprise-class security solutions like Qualys to find and help us fix vulnerabilities in the IT infrastructure and the web application. Reports from the latest third-party intrusion tests, as well as Qualys reports, are available upon request.
